

Student Burnout Tracker

System Architecture & Class Diagram Specification

Document Overview: This specification details the object-oriented design of the Student Burnout Tracker application. The system follows a layered architecture dividing Core Domain Models, Business Logic, Data Persistence, and a Swing-based Graphical User Interface (GUI).

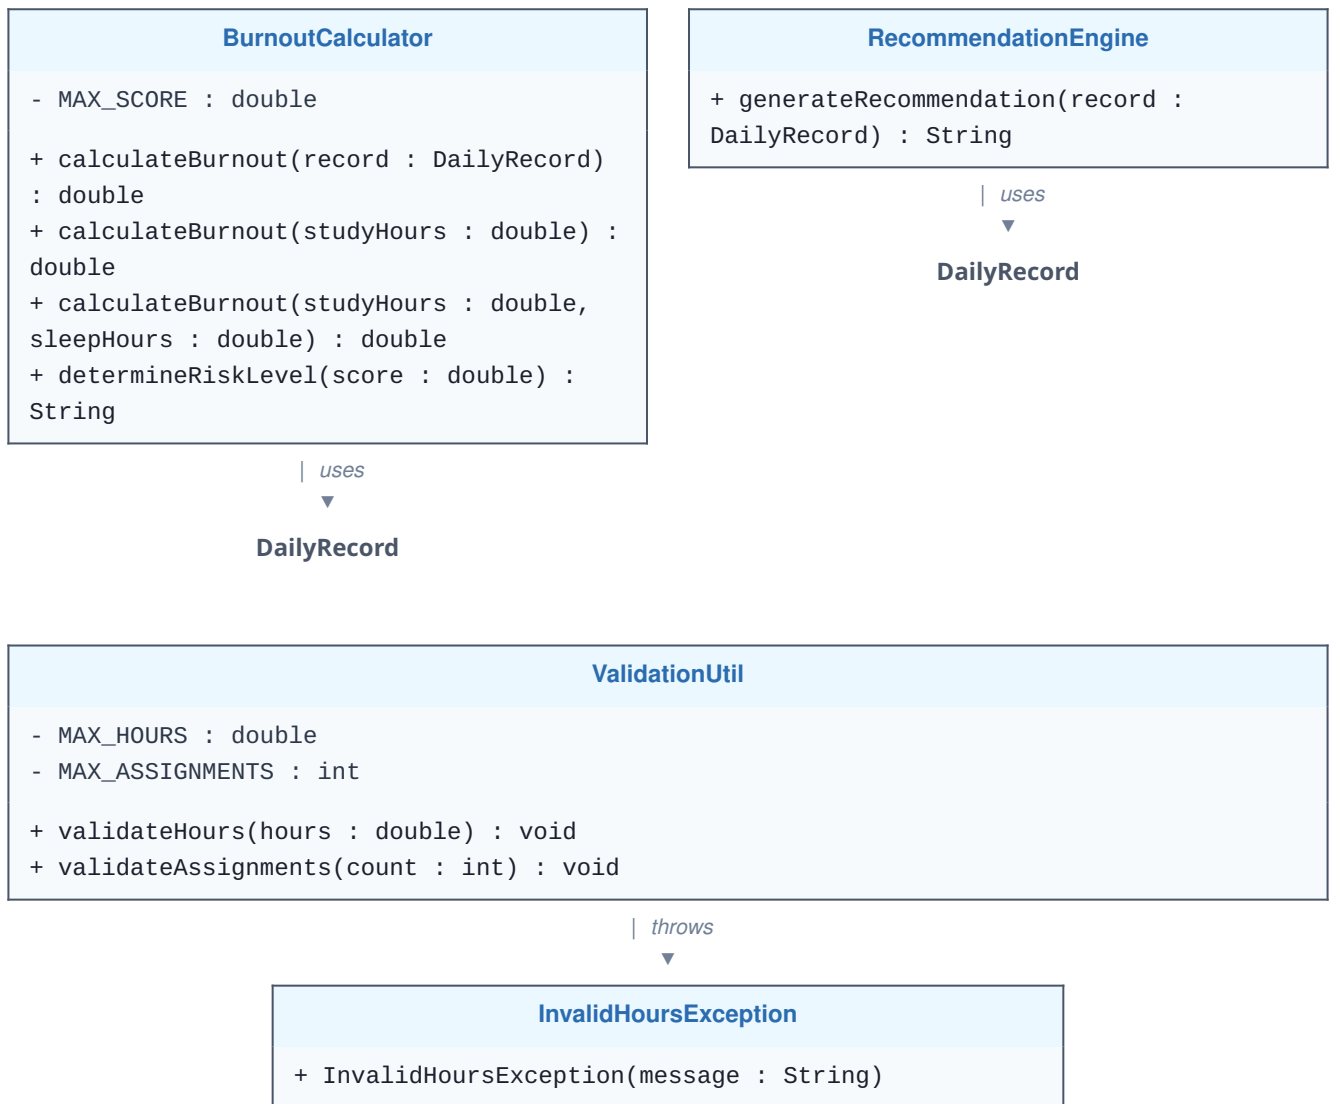

1. Core Domain Layer (Models & Polymorphism)

The core domain leverages polymorphism to evaluate the mental and physical impact of daily activities.

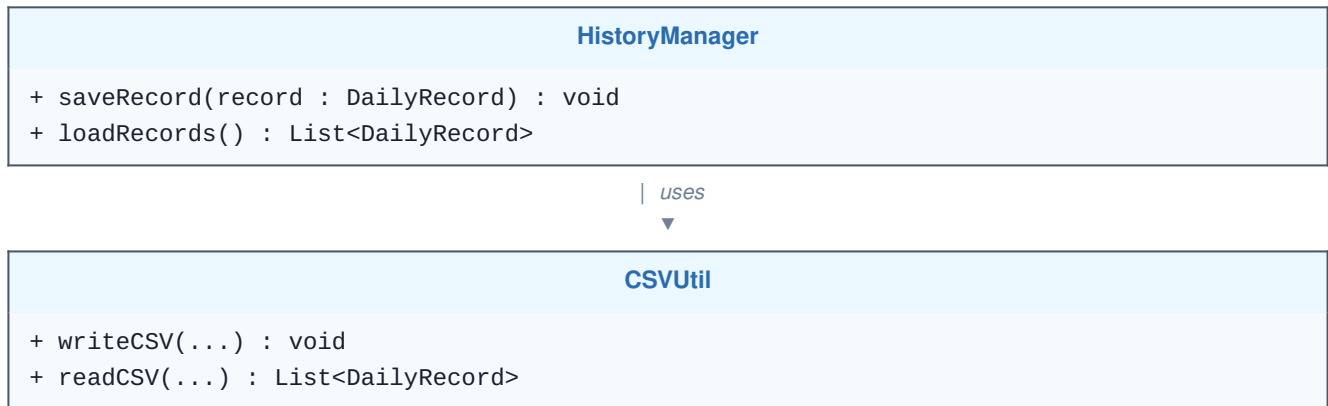

2. Business Logic & Utility Layer

Responsible for validation, score processing, and algorithmic recommendations.

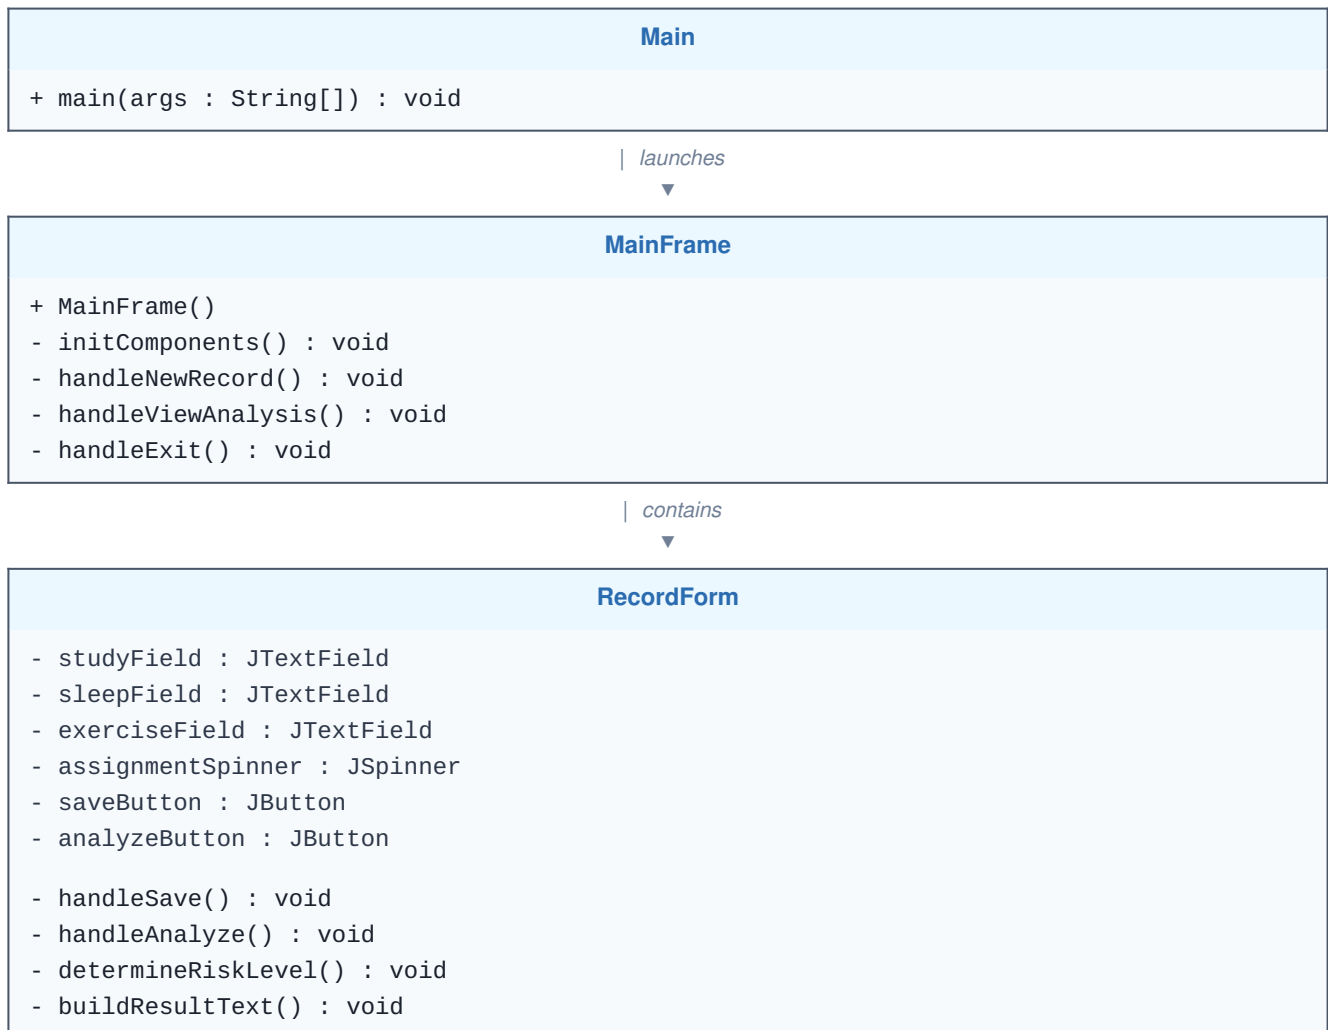

3. Data Persistence Layer

Handles structured serialization and deserialization of metrics to long-term flat-file CSV systems.

4. Presentation / GUI Layer

Implements user interface components using Java Swing framework primitives.
